

### Application

Cimtech A31F is a new type of synthetic fluid for heavy duty grinding and machining operations, including milling and high speed machining. It is designed primarily for demanding operations in hard and difficult alloys where it has proven to create substantial productivity improvements.

Cimtech A31F can be used in individual machines as well as in central systems.

### Features and benefits

Cimtech A31F is designed primarily to improve productivity in demanding grinding and machining operations in hard and difficult alloys such as stainless steel, titanium, nickel and other aerospace alloys. For use with other metals and processes please consult the compatibility guide on page two, or contact your local Cimcool representative.

Cimtech A31F is highly cost effective, due to its low make-up rates and long fluid life. Cimtech A31F provides excellent lubrication and cooling, and does not foam when used at recommended concentration. The complete transparency of the mix enables good visibility in the cutting zone, and it has a magnificent washing action and superior cleanliness. In addition, Cimtech A31F rejects tramp oil and is low misting. The ingredients in Cimtech A31F provide no nourishment for bacteria ensuring exceptional long fluid life. Operators otherwise sensitive to traditional fluids generally appreciate the low pH, complete transparency and neutral smelling properties of Cimtech A31F. Cimtech A31F does not contain sulphur, chlorine, formaldehyde, diethanolamine or boron. Additives should only be used after consulting a Cimcool representative.

### Physical and chemical properties

Appearance:	Yellow liquid
Odour:	Mild
Density:	1,075
pH (concentrate):	8,6
pH (operating):	8,0

## Recommended starting concentration

Milling, drilling, turning, reaming and grinding	5 - 8%
Wrought and cast aluminium alloys, carbon and stainless steel, titanium and exotic alloy	5 - 8%

Use of lower concentrations than recommended above may cause foaming, corrosion and/or rancidity.

Metal and water compatibility					
Type of metal	Copper and Copper alloys such as brass and bronze	Aluminium	Cast iron	Steel, carbon- & stainless steel	Titanium and other 'hard' alloys
<b>Compatibility</b>	Compatible only for occasional application, but beware of risk of staining of parts, residue formation in machines and/or discoloration of mix. Regular addition of Inhibitor EC can reduce, but not eliminate this risk.	Excellent with hard Al (typically wrought and cast Al). In soft Al beware of chip build up on tools in high-speed threading, tapping and deep hole drilling operations compared to oil based fluids. For use with very special grades of Al a staining test is recommended before using the product. Mixing with demineralised water will give improved Al corrosion protection.	Compatible, but beware of increased risk of corrosion - in particular chip corrosion - compared to conventional oil based fluids.	Excellent	Excellent
<b>Water compatibility</b>	It is advised to mix only with demineralised water or good quality tap water: maximum 10°GH; maximum 25 ppm chloride. Exceeding these limits may, in time, cause lime deposits and/or corrosion. It is recommended to keep the chloride concentration in the mix below 350 ppm to ensure satisfactory ferrous corrosion control.				
<b>Remarks</b>	Being free of mineral oil Cimtech A31F may have a tendency of leaving a more sticky residue than traditional oil based fluids, in particular on open machines. However, regular spraying with a 1% solution of Cimclean 51 followed by wiping with a cloth (prevent fluid contamination) will easily remove such residue. Beware of residue when using measuring instruments and clean moving parts frequently. Applying a thin coat of Cimguard 20 may prevent such problems, and will not interfere with instrument measuring accuracy.				

The above are general guidelines for single use on the above metals only. For suitability on materials not mentioned, or suitability for mixed machining of various metals with the same fluid in the same machine/system, contact your local Cimcool representative.

## Mix Master S

Concentration\*\* can easily be obtained by setting the regulator to the correct number. \*\* The concentration may vary depending on local conditions. It is therefore always advised to check using the refractometer or TA Kit.

## Concentration analysis

For concentration analysis, use one of the below given methods or an appropriate laboratory procedure available from your local stockist.

Refractometer factor:	1.5
-----------------------	-----

If the refractometer is used, the resultant reading multiplied by a factor of 1.5 will only be relevant when applied to a fresh mix.

Cimcool TA kit	Use 2 ml. mix									*: next syringe
%	1	2	3	4	5	6	7	8	9	10
Reading	0.87	0.73	0.59	0.45	0.30	0.16	0.02	*.87	*.73	*.60

## Handling and storage

Protect from freezing, direct sun and store between 5 - 35°C.

## Packaging type

5, 25, 200, 1000 litre and bulk.

## Safety Data Sheet

The Safety Data Sheet should be consulted for specific information and information on Health, Safety and Environment when handling this product.
